

INSECT CONTROL FOR BUILDINGS

ABSTRACT

The intrusion of insects into a home or similar
5 building is controlled by utilizing insect controlling
plastic materials in the construction of the building. The
insect controlling plastic building materials are
manufactured by first blending one or more plastic resins
with one or more insect controlling chemical agents to form
10 a blended plastic resin/insect controlling chemical agent
material. The blended plastic resin/insect controlling
chemical agent material is then utilized to manufacture
plastic films, sheets, non-woven fabrics, woven fabrics,
insulating foams, flooring materials, wall covering
15 materials, and the like utilizing conventional
manufacturing techniques.
